

Code the **Future**

FEATURE DELIVERY REPORT

Platform features shipped June 9–11, 2026

A summary of the features deployed to codethefuture.net between Tuesday evening and Thursday morning, covering the learning experience, the public website, staff tooling, and safety infrastructure. All items are live in production and verified.

PUBLIC WEBSITE

1

STAFF CONSOLE

Module 1 became a world, not a worksheet

Twelve missions, 154 screens, sixteen hands-on activities. Kids don't read about AI — they poke it, train it, and draw for it.

- **"AI or Not?" Arcade — Mission 1's new finale**

Twelve everyday things zoom in one at a time — smart speaker, toaster, YouTube recommendations — and the kid calls it: AI, or just a machine? Seven-second timer, score, streak multipliers, and an instant one-line "why" after every call. Module 1 now opens with a bang.

- **Draw for a real AI** LIVE AI

Kids draw on a canvas and an actual vision model looks at their pixels and guesses the picture. Not a simulation — the exact concept Mission 5 teaches, demonstrated on the kid's own art.

- **Three more concept games**

Word Chain (build a sentence by picking next words with visible probabilities — how language models actually work), Training Pipeline (put the steps of training in order), and Light the Network (spend limited strength points on connections to make a signal reach the output — weights, made tactile).

- **Video breaks**

Six short Code.org "How AI Works" videos embedded at exactly the right moments, in privacy mode.

- **Mission art that explains itself** AI-GENERATED

The abstract diagrams are gone. Every mission opens with a picture-book scene of a kid and robot doing that mission's concept, plus a caption that lands the idea ("Training = showing a computer LOTS of examples...").

- **Real AI history, license-verified**

Mission 9 is now a photo gallery: Ada Lovelace, Alan Turing, the actual 1966 ELIZA chat transcript, Shakey the robot, and a Deep Blue tower — all public-domain or Creative Commons, credits included.

- **Audio learning**

One toggle and every screen reads itself aloud in a warm narrator voice (ElevenLabs) — for early readers and ear-first learners. Music ducks underneath automatically.

- **Study Beats — an endless lo-fi radio** GENERATED LIVE

A music dock composes lo-fi beats in real time — no audio files, no licensing. Kids pick vibes, change tempo, add vinyl crackle or rain, and remix the whole beat. As of last night it evolves while it plays: new drum patterns every section, improvised melodies, gentle key changes. It is itself a generative-AI lesson.

Designed so kids come back

- **Drip pacing in three parts**

Missions 1–4 open on day one; 5–8 unlock two days later; 9–12 two days after that — anchored to each cohort's start date. Finishing a part earns a warm "your brain needs time to let this settle" screen, not a wall. Parents always have a reason to send kids back.

- **Badges + character gear**

Every mission awards custom AI-generated badge art plus a new accessory for the kid's avatar — capes, jetpacks, crowns, a champion's laurel. Avatars are alive now: they blink, bob, and get excited on hover.

- **Mission Map: replay and fast-forward**

A map button in the player lists every mission — finished ones replay, the current one jumps to your exact spot, locked parts show their unlock day. Progress is bulletproof now: a "furthest-reached" marker syncs to the cloud, so switching devices or clearing a browser can never lose a kid's progress.

A clubhouse with guardrails

- **Live chat + private messages**

Cohort-wide chat plus one-tap private messages: tap any member's avatar, see their profile card, hit "Chat with...". An "online now" strip shows who's around, with live green dots on the roster.

- **Profanity filtering at two layers**

Blocked in the browser before sending and enforced again inside the database — it cannot be bypassed by clever kids. Chat notes remind everyone that staff can see all messages, including private ones.

- **FAQ & AI Dictionary**

Twenty kid-voiced Q&As on the board: how the platform works, plus AI terms explained for ages 8–11.

- **One consistent platform shell**

Every page shares a branded header — logo, Home / Missions / Board / Profile pills, breadcrumbs — so kids always know where they are and how to get home.

codethefuture.net now sells the camp

The root of the domain is a full marketing site; the kids' platform lives behind Log In, protected by its own password gate.

- **The pitch, structured**

Hero with a slot for Jon's film, "why your kid needs this," six platform selling points, a scrolling marquee of the real badge art, living avatar crew, the public-library labs, and the child-psychologist partnership — coach and psychologist featured in the hero copy.

- **Cohort listings + lead capture**

Session cards with dates and openings; "Save My Spot" form delivers parent leads to the Netlify dashboard and email — verified end to end. SEO meta, social cards, and structured data are in place for Google.

- **Platform password gate**

The sales site is public; everything under /platform and the missions still asks for a shared password (currently set) until launch. The gate can never lock anyone out by accident.

05 • MISSION CONTROL — FOR YOU AND JON

The staff console

- **Cohort progress at a glance**

Every kid: avatar, current mission, progress bar, badge art, last-active time — plus signals that flag who needs attention (not started / quiet 3+ days / behind the unlocked part). Each row has a DM button straight into a private chat.

- **An inbox that knows what's unanswered**

Private messages to staff are flagged "reply" until you respond; Help & Questions posts are flagged until a staff member comments.

- **Slack notifications — live**

The moment a kid sends staff a private message or posts in Help, a Slack ping lands with the kid's name, a preview, and a reply link. Confirmed working this morning.

ACCESS

Mission Control lives at codethefuture.net/platform/admin.html — bookmark it; it's deliberately not in the kids' navigation. Kenya: create your character on the platform, join with code **FUTURE26**, tell Jon your character name, and you'll be promoted to staff with full console + notification access.

See it the way a kid will

1. **Sales site.** Open `codethefuture.net` — scroll the whole page; this is what parents see first.
2. **Log In** (top right) → enter the platform password from Jon → create your character. Try a face and an accessory.
3. **Join the cohort** with code `FUTURE26` when the board asks.
4. **Play Mission 1.** Watch the words trickle in, meet the new mission art, take the warm-up poll, then play the **AI or Not? arcade** — chase a streak.
5. **Turn on the extras.** Tap the music note for Study Beats (hit Remix twice), and "Turn on audio learning" to hear a screen read aloud.
6. **Earn the badge**, then open your Profile and put your new gear on your character.
7. **Open the Mission Map** (top bar) — see replay, your spot, and the locked parts with unlock days.
8. **Visit the Board.** Read the FAQ, then tap a member and send a private hello.
9. **DM "Mr. Jon"** — and watch the Slack channel ping within seconds. That's the staff alert pipeline.
10. **Peek at Mission Control** (once promoted): `/platform/admin.html` — the whole cohort on one screen.
